Excerpt: . . . with infections disappearing during the rainy period (July-August) when run-off increased and visibility declined, even though temperatures were approaching their annual maxima. Furthermore, high turbidity was one of the major factors limiting the spatial distribution of BBD in La Parguera. Infections were restricted to shallow water on turbid inshore reefs, even though species susceptible to BBD occurred in shallow and deep water, while BBD occurred to depths of 30 m on offshore reefs with high water clarity. The disease was also common in remote locations around Mona Island, which is 70 km from the mainland of Puerto Rico and lacks permanent inhabitants, industry or agriculture (there is a small Puerto Rico Department of Natural and Environmental Resources facility and camping is permitted) and reefs are unaffected by river discharge (Bruckner, 1999). Table 5. A comparison of published quantitative studies on black-band disease from the Caribbean. Location Survey information...
