Paperback. 160 pages. Dimensions: 11.0in. x 8.5in. x 0.4in. Diseases associated with dietary excess and imbalance rank among the leading causes of illness and death in the United States. Major diseases in which diet plays a role include coronary heart disease, some types of cancer, stroke, hypertension, obesity, osteoporosis, and non-insulin dependent diabetes mellitus. All are major causes of morbidity and mortality in this country. Although diet is associated with multiple health outcomes, the relationships between specific dietary elements and specific health outcomes have been studied extensively. The role of the primary care provider in either providing direct diet counseling or enlisting the help of other health professionals has been studied extensively, but controversy remains about the effectiveness of different strategies. In . Evaluating Primary Care Behavioral Counseling Interventions: An Evidence-based Approach, . Whitlock et al. described a detailed framework for primary care counseling. To address the question of the role of diet in chronic disease as well as dietary assessment and counseling in primary care, staff of the RTI . University of North Carolina Evidence-based Practice Center undertook this systematic evidence review (SER) on behalf of...
